Life in 2030

In 2030 life will be different. People will live in cardboard boxes, all the materials will be recycled.

These houses will have solar panels on the roof, so they can generate all their own electricity. The roof also will collect rainwater for bathing and washing.

People won't communicate by smartphone in 2030; everybody will have a gadget to communicate themselves through their minds. The gadget will be very small. People can carry them in their ears.

Food will be different, you will buy some pills which will replace different dishes. That will be very useful, for example, when you are at school and you feel hungry, you can have a pill instead of a sandwich.
